PROFILE

Design-minded product engineer. I find the problems nobody assigned and take them from idea to shipped: most recently a build recommendation feature at Coachless, where I designed the scoring algorithm and built the interface. I work AI-assisted: fast prototypes, tight iteration, and I don't ship until it's something I'd use myself.

EXPERIENCE

Frontend Developer & Product Design

Coachless.gg — League of Legends analytics SaaS

May – Aug 2026

Espoo, Finland

- **UI/UX design:** Identified and documented issues by using the site, looking at PostHog and gathering user feedback from beta testers I recruited myself. Implemented multiple UI/UX improvements across the site, such as refined tables, improved mobile view, fixed small bugs and improved copy texts. Refactored and consolidated the frontend code. *Stack: SCSS, HTML, TypeScript, Angular.*
- **Data visualisation:** Researched 2D data visualisation, prototyped several approaches, and shipped indicator bars that show effect size (WPA) and sample reliability in one element. Own idea, from research to production code.
- **Product:** Worked directly with the CEO on feature direction, strategy, copy texts and design. Created designs and prototypes iteratively for multiple features.
- **Algorithm design:** Designed and implemented the algorithms behind the build recommendation feature, so that small-sample builds are not mistaken for strong ones. Built a working prototype that my friends and I use every match.
- **Own initiatives:** Built a desktop companion app (Electron) connecting to the League client for direct imports from Recommended Builds. Developed Itemdle, a daily Wordle-style item guessing game. Made a complete overhaul to the landing page. All from concept to working product.

Software Developer

ABB — full-time Jun–Aug 2023, then part-time (50%) alongside studies

Jun 2023 – Mar 2024

Helsinki, Finland

- Optimised CI/CD pipelines, reducing deployment steps and shortening delivery time.
- Designed a flexible unit test system that improved code quality and debugging speed for the team; took initiative on unassigned problems across teams.

Full Stack Developer (project course)

Aalto University

2022 – 2023

Espoo, Finland

- Built responsive UIs with React and TypeScript, backend services in Scala with MySQL, and end-to-end and unit tests, across a term of team development.

PROJECTS

Personal Portfolio Website | *React, Vite, TailwindCSS, Git*

2025 – present

- Designed and deployed a responsive personal site with an automated GitHub Pages deployment workflow.

“Janitor” IoT Controller | *Python, Docker, REST API, Raspberry Pi*

2025

- Replaced a slow vendor cloud application with a low-latency local server; traced the original unresponsiveness to hardware firmware limits through systematic debugging.

Personal Knowledge System | *Markdown, Git, Syncthing, TypeScript*

2025 – present

- 300,000-word linked knowledge base with p2p sync, plus a custom plugin pulling Oura API biometrics into daily notes.

EDUCATION

Aalto University

M.Sc. Computer Science — 270/300 credits, GPA 4/5; thesis remaining

Espoo, Finland

2023 – present

Aalto University

B.Sc. Computer Science

Espoo, Finland

2019 – 2023

Reserve Officer School, Finnish Defence Forces

Leadership training

Hamina, Finland

2020 – 2021

TECHNICAL SKILLS

Frontend: Angular, React, TypeScript, JavaScript, SCSS, HTML, TailwindCSS, Vite, Nx

Design: UI/UX design, data visualisation, prototyping, design systems, PostHog analytics

Other languages: Python, Scala, Java, C/C++, C#, SQL (Postgres, MySQL)

Tools: Git, Docker, Electron, Node.js, GCP, Linux, AI-assisted development (Claude Code), CI/CD, Agile

Languages: Finnish (native), English (fluent)
